

Phosphorus Free Detergent Register

Most household detergents contain high levels of phosphorus (P) or phosphates. Phosphates are builders which decrease the hardness of water allowing the detergent to wash clothes, dishes and cars better. Phosphorus also endangers our waterways. In unsewered areas, phosphorus from detergents ends up in creeks, wetlands and rivers via groundwater. Phosphorus from detergents used to wash cars on driveways can enter stormwater drains and waterways. This feeds algal blooms, can kill aquatic invertebrates and can be absorbed through the skin of frogs.

It's so easy to reduce phosphorus use at home and help ease the load and threat to our waterways.

Buy products which do not contain phosphorus

Look for these words:

- zeolite
- alternative builders
- phosphorus or phosphate free

Avoid products containing phosphorus

Look for these words:

- STPP (sodium tri-polyphosphates)
- polyphosphates
- phosphate builders

NP

Means there is NO PHOSPHORUS in the product

P

Means there is a small amount of phosphorus in the product

Remember,
biodegradable
does not mean
phosphate free!

The detergents over the page are all phosphorus free. Please note, even though they are phosphorus free it does not mean that they are all environmentally friendly, for example bleaches. If you intend to use greywater from your washing machine to water your garden you will need to use a phosphorus free and low salt detergent. To find out what detergents are suitable to use in greywater systems go to **www.lanfaxlabs.com.au**.

Please note that not all phosphorus free detergents are on this list. If you know of a phosphorus free detergent not mentioned here please take the time to let us know.
